Instrument information

Instrument type Flow Calibrator Manufacturer Mesalabs Model Definer 220H Serial number 115673 Tag number C63

Calibration method

The temperature calibration is done by compairing the DUT reading to a PT-100 reading in Air. The pressure DUT is directly, connected to a pressure standard to compare pressure readings. The flow measurements are

made in a parallel setup.

A flow source is connected to the inlet of the instrument to generate a flow.

The laboratory environment was maintained at 21°C \pm 2°C and 40%rh \pm 20%rh. **Environmental conditions**

The atmospheric pressure at the time of calibration was 1021 mBar.

Date (or period) of calibration

15 May 2020 - 18 May 2020

Results The results of the calibration are presented on the following page(s).

Uncertainty The reported uncertainty of measurement is based on the standard uncertainty multiplied by a coverage

factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.

The standard uncertainty of measurement has been determined in accordance with EA-4/02.

Traceability The measurements have been executed using standards for which the traceability to (inter)national

standards has been demonstrated towards the RvA.

Note

1 The deviation is determined by :	Deviation =	Instrument reading - Reference	* 100 %
1 The deviation is determined by :		Reference	

² Calibrations are performed at mentioned pressure and temperature conditions. Reference temperatures are defined according the ITS-90.
